

Aprigo CloudLock for Google Apps

Regain Control of Your Corporate Documents

The Power & Protection of CloudLock

- **Identify and fix document exposure**
- **Remove unwanted collaborators**
- **Transfer ownership between users**
- **Analyze application usage by end users**
- **Audit all documents & users within a domain and their privileges**
- **End user enablement – Grant access to non Google admins**
- **Enforce corporate information-sharing policies**
- **Continuously monitor data exposure with change alerts**
- **Provide better support to end users**

Google Docs' fast, cost-effective collaboration features make critical business documents more accessible and portable than ever before – and is quickly becoming the reason why more and more organizations are migrating to the strategic productivity platform. However, Google Docs does come with its risks, as IT managers suddenly find themselves as outsiders looking in on end-user activity

rather than being able to proactively manage it. This lack of visibility and control into the document creation and publishing process, and lack of governance controls puts data security and access controls into the hands of the users themselves; a scenario that hinders the value of their implementation. As a result, IT teams are struggling to:

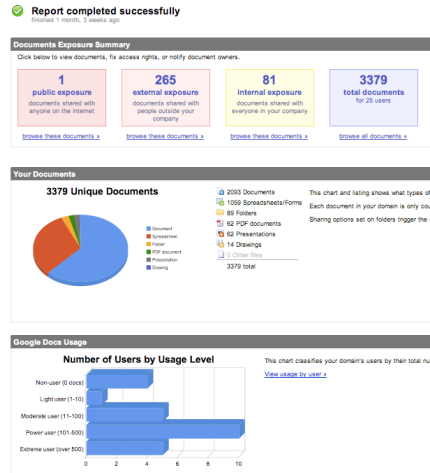

- Keep confidential or sensitive content protected from unauthorized viewing
- Define and enforce information-sharing policies
- Understand user adoption and utilization of Google Docs
- Rapidly address end-user inquiries and issues related to the application

Aprigo delivers the capabilities IT Managers need to overcome these obstacles and optimize return on their Google Docs investment. Aprigo's CloudLock for Google Apps gives organizations greater control over their Google Docs solution, providing them with valuable insight into who is using the application and how, which documents are exposed, and a way to quickly fix these exposures. With Aprigo, organizations can now safely turn on Google Docs, knowing that they can govern how documents and other data are shared within and outside of the company.

Protect Your Corporate Data - Comply With Privacy Regulations

Rapid Setup

- **Marketplace Application** installs in seconds
- **Built on Google App Engine**
- **OPENID** for single sign-on

Insight into what documents exist and how they are shared empowers you to more effectively govern your company's content.

Powerful Document Intelligence

A user-friendly document browser enables Aprigo CloudLock for Google Apps users to generate complete lists of all their company's documents, categorized by document name, owner, number of collaborators, or the properties of each individual document i.e. sharing permissions. This provides greater visibility into the Google Docs environment to better control corporate content. Using CloudLock for Google Apps, documents owned or managed by former employees, outside contractors or other third parties can be rapidly identified through a few simple steps.

Fix and Control Excessive Access Rights

Aprigo CloudLock for Google Apps provides insight and control into document exposure at both the summary and granular levels. Domain admins can quickly discover documents containing sensitive or confidential data, including those that may be at risk, and verify that files are only shared with authorized viewers.

If exposed content is identified, **unwanted sharing permissions can be removed** and email notifications can be quickly sent to the end-user.

Transfer Data Ownership

When a Google Apps domain administrator deletes a user account, the documents and files owned by that user are automatically deleted. This leads many organizations to 'suspend' accounts instead of deleting them, requiring companies to hold on to and pay for orphaned accounts of employees that are no longer there.

With CloudLock for Google Apps, administrators can **transfer ownership of documents from one user to another**, and do so as a bulk operation. With CloudLock, simply transfer ownership of the documents you want to keep, then delete the user. It's that easy.

Offload Work From IT Through End User Enablement

Managing the security of corporate data can be overwhelming and is further complicated by the fact that as the custodians of the data, the Google Apps domain administrators have no visibility into the importance and sensitivity of data itself. Aprigo CloudLock for Google Apps enables IT to empower the data owners in managing the security and privacy of the data they own. Additionally, the domain admin can now add designated business users or department managers as Aprigo users. They will be able to gain visibility into departmental usage, access rights and enforce sharing policies.

Usage and Statistics Tracking

Powerful, intuitive reports and statistics – including document classification and usage patterns – enable technology professionals to accurately track adoption rates and understand how users are leveraging the Google Docs platform.

Advanced Security

Aprigo CloudLock for Google Apps includes robust security features. Because it is a Google Marketplace solution, the process of granting privileges to access and use Aprigo CloudLock is fully protected. IT Administrators can also immediately remove or disable the application at any time.

CloudLock for Google Apps built on Google's App Engine infrastructure and is accessed exclusively over encrypted transport (https). All information is accessed using the secure published Google Apps APIs as well as encrypted transport. These overlapping security measures almost completely eliminate the threat of security breaches.

About Aprigo

Headquartered in Waltham, Mass., Aprigo is the cloud data protection company that enables control of data while gaining the collaboration and cost savings benefits of the cloud. Unlike expensive custom solutions, Aprigo's enterprise-class products are directly integrated with cloud application providers and are immediately available at a fraction of the cost.
